Spark DataFrame SQL

Jim Harner 1/6/2020

Load sparklyr and establish the Spark connection.

5.3 Spark DataFrame SQL

sparklyr can import a wide range of data directly into Spark from an external data source, e.g., json. In addition, it is possible to query Spark DataFrames directly.

We will be using the nycflights13 data again. The flights and airlines R data frames are copied into Spark.

```
library(nycflights13)
flights_sdf <- copy_to(sc, flights, "flights", overwrite = TRUE)
airlines_sdf <- copy_to(sc, airlines, "airlines", overwrite = TRUE)</pre>
```

5.3.1 Joining Spark Data Tables

In Section 5.2.1 the dplyr verbs were used to manipulate a Spark DataFrame. However, we often have multiple related Spark tables which we need to combine prior to performing data manipulations.

A workflow was developed in Section 5.2.1 to find the flights with a departure delay greater than 1000 minutes. However, we did not have the carrier names since they were in a different table. Providing this information can be done with a left_join.

```
flights_sdf %>%
  left_join(airlines_sdf, by = "carrier") %>%
  select(carrier, name, flight, year:day, arr_delay, dep_delay) %>%
  filter(dep_delay > 1000) %>%
  arrange(desc(dep_delay))
```

```
## # Source:
                 spark<?> [?? x 8]
## # Ordered by: desc(dep_delay)
##
     carrier name
                                     flight year month
                                                            day arr_delay dep_delay
##
     <chr>>
             <chr>>
                                       <int> <int> <int> <int>
                                                                    <dbl>
                                                                               <db1>
## 1 HA
             Hawaiian Airlines Inc.
                                         51 2013
                                                       1
                                                              9
                                                                     1272
                                                                                1301
## 2 MQ
             Envoy Air
                                        3535 2013
                                                       6
                                                             15
                                                                     1127
                                                                                1137
## 3 MQ
             Envoy Air
                                        3695
                                             2013
                                                       1
                                                             10
                                                                     1109
                                                                                1126
                                                             20
## 4 AA
             American Airlines Inc.
                                        177 2013
                                                       9
                                                                     1007
                                                                                1014
## 5 MQ
                                        3075 2013
                                                                      989
                                                                                1005
             Envoy Air
                                                             22
```

Notice that three of the top five largest delays were associated with Envoy Air, which was not obvious based on the two-letter abbreviation.

dplyr has various verbs that combine two tables. If this is not adequate, then the joins, or other operations, must be done in the database prior to importing the data into Spark

5.3.2 Querying a Spark DataFrame

It is also possible to use Spark DataFrames as tables in a "database" using the Spark SQL interface, which forms the basis of Spark DataFrames.

The spark_connect object implements a DBI interface for Spark, which allows you to use dbGetQuery to execute SQL commands. The returned result is an R data frame.

We now show that the above workflow can be done in R except that R data frames are used.

```
library(DBI)
flights_df <- dbGetQuery(sc, "SELECT * FROM flights")
airlines_df <- dbGetQuery(sc, "SELECT * FROM airlines")
flights_df %>%
  left_join(airlines_df, by = "carrier") %>%
  select(carrier, name, flight, year:day, arr_delay, dep_delay) %>%
  filter(dep_delay > 1000) %>%
  arrange(desc(dep_delay))
```

##		carrier			name	flight	year	month	day	arr_delay	dep_delay
##	1	HA	${\tt Hawaiian}$	Airlines	Inc.	51	2013	1	9	1272	1301
##	2	MQ		Envoy	y Air	3535	2013	6	15	1127	1137
##	3	MQ		Envoy	y Air	3695	2013	1	10	1109	1126
##	4	AA	American	Airlines	Inc.	177	2013	9	20	1007	1014
##	5	MQ		Envo	y Air	3075	2013	7	22	989	1005

Of course, this assumes the Spark DataFrames can be imported into R, i.e., they must fit into local memory.

The by argument in the left_join is not needed if there is a single variable common to both tables. Alternately, we could use by = c("carrier", "carrier"), where the names could be different if they represent the same variable.

5.3.3 Sampling

We can sample random rows of a Spark DataFrame using:

- sample_n for a fixed number;
- sample_frac for a fixed fraction.

```
sample_n(flights_sdf, 10)
```

```
## # Source: spark<?> [?? x 19]

## # ... with more rows, and 11 more variables: arr_delay <dbl>, carrier <chr>,
```

Sampling is often done during the development and testing cycle to limit the size of the data.

distance <dbl>, hour <dbl>, minute <dbl>, time_hour <dttm>

flight <int>, tailnum <chr>, origin <chr>, dest <chr>, air_time <dbl>,

5.3.4 Writing Data

#

##

We can save the results of our analysis or the tables that you have generated in Spark into persistent storage. Parquet is a commonly used persistent store for various data processing systems in the Hadoop ecosystem. It has a columnar storage format which Spark SQL supports for both reading and writing, including the schema of the original data.

As an example, we can write the airlines_sdf Spark DataFrame out to a Parquet file using the spark_write_parquet function.

```
library(rhdfs)
## Loading required package: rJava
##
## HADOOP_CMD=/opt/hadoop/bin/hadoop
##
## Be sure to run hdfs.init()
hdfs.init()
spark_write_parquet(airlines_sdf,
                  path = "hdfs://hadoop:9000/user/rstudio/airlines_parquet",
                  mode = "overwrite")
hdfs.ls("/user/rstudio")
##
                                               modtime
     permission
                  owner
                           group size
## 1 drwxr-xr-x rstudio rstudio
                                    0 2020-01-09 03:39
```

file

1 /user/rstudio/airlines_parquet

This writes the Spark DataFrame to the given HDFS path and names the Parquet file airlines_parquet.

You can use the spark_read_parquet function to read the same table back into a subsequent Spark session:

```
## # Source: spark<airlines2_sdf> [?? x 2]
##
      carrier name
##
      <chr>
              <chr>
##
  1 9E
              Endeavor Air Inc.

## 10 MQ
              Envoy Air
## # ... with more rows
```

Use the <code>spark_write_csv</code> and <code>spark_write_json</code> functions to write data as csv or json files, respectively.

```
spark_disconnect(sc)
```
